

HORIZON BANK SYNTHETIC DATA

Build believable banking data.

Tell your coding agent what you are prototyping, add the Horizon Bank Synthetic Data Generator plugin, and refine the results in plain language.

One plugin. Many data shapes.

Begin with a journey, prototype, schema, or rough idea. The plugin can plan, generate, serve, adapt, and validate coherent synthetic banking data.

Start in three steps

01

Start a new coding task

Open a fresh task so Codex loads the latest installed plugin and its three synthetic-data skills.

02

Add the plugin

Choose @horizon-bank-synthetic-data-generator, or ask to use the Horizon Bank Synthetic Data Generator plugin.

03

Describe the outcome

Name the journey, consumers, required fields, state behavior, scale, and output you want.

A plugin is a bundle. Skills do the work.

Ask naturally. Codex routes discovery, generation, and quality checks to the appropriate Horizon skill.

Horizon Bank
Synthetic Data
Generator

Plan the data
Generate the data
Validate the data

Personas + overlays

9 archetypes · 12 scenarios

Seeded records

Dates · money · relationships

Portable delivery

Files · SQLite · Mongo · REST

Strict validation

Privacy · math · parity

A strong brief is four lines,
not four pages.

PRIMARY TASK

Name the journey and user outcome

CONSUMERS + FIELDS

List must-show information and tools

TIME + STATE

Choose fixed or rolling; read-only or mutable

DELIVERABLE

Choose files, database, API, adapter, or audit

MAKE IT YOUR OWN

Shape the dataset with six choices.

The plugin is a planning system and executable toolkit, not a rigid fixture. Change the journey, contract, time behavior, scale, delivery, and narrative mode while keeping the Horizon Bank data coherent.

Prompt formula

Use Horizon Bank Synthetic Data Generator to [plan, generate, or validate] a [prototype journey] for [audience]. Include [archetypes, overlays, scale, dates, and outputs]. Deliver [files, database, API, adapter, or report].

Malleable by design

Change any dial without losing the coherent source of truth.

Experience

Voice · dashboard · wearable · agent · test

Delivery

JSON · JSONL · CSV · SQLite · Mongo · REST

Time + state

Fixed · rolling · read-only · mutable adapter

Scale

Small · medium · large · exact custom counts

Narrative

Template · none · controlled LLM slots

Acceptance

Journeys · edge states · financial invariants

Copy, paste, and remix

VOICE AGENT

Plan nine customer profiles for balances, recent activity, and dispute status. Deliver JSON fixtures plus compact LLM context.

WEARABLE

Create a minimal read-only customer snapshot with short labels, stable IDs, alerts, and deterministic balances for a glanceable display.

DATABASE + API

Create a medium seeded dataset with SQLite and Mongo exports, then expose local read-only customer and transaction endpoints.

DASHBOARD

Generate checking, savings, cards, budgets, goals, alerts, and pending/posted transactions for a responsive account dashboard.

BUSINESS BANKING

Generate linked owners, businesses, deposit accounts, cards, payroll-like income, loans, delegations, and cash-flow events.

VALIDATE EXISTING DATA

Audit these fixtures for privacy, stale dates, duplicate facts, unresolved references, ledger math, and export drift. Fix the source rule.

A USABLE START

“Make synthetic bank data for my prototype.”

A STRONGER ASK

“Plan and generate nine customers for a read-only voice prototype. Include balances, five recent transactions, pending activity, and dispute status. Use a fixed July 27, 2026 scenario date, JSON plus SQLite, and run strict reproducibility validation.”

TIP Iterate conversationally: “make it smaller,” “use Mongo,” “add overdraft risk,” “build a compact voice context,” or “validate before we share it.” Keep it synthetic; never add credentials or regulated identifiers.
